

TaskFlow — Project README

How to Run the Project Locally with VS Code Live Server

Name: Gamaliel Egbuchiri

Matric Number: AFIT/ICT/18/0014

Introduction

TaskFlow is a task manager and scheduling web app built entirely with HTML, CSS, and vanilla JavaScript — no frameworks, no backend, and no build tools. It lets a user create, organize, prioritize, and track tasks, with support for due dates, subtasks, recurring schedules, and a calendar and analytics view. All data is stored locally in the browser, so the project can run entirely on the frontend.

This guide explains, step by step, how to open the project in Visual Studio Code and run it locally using the **Live Server** extension, so it can be viewed and tested in a browser exactly as it behaves when hosted online.

Step-by-Step: Running the Project with Live Server

1

Step 1 — Open VS Code

Launch Visual Studio Code on your computer. If the Live Server extension is not yet installed, go to the Extensions panel (the icon on the left sidebar, or press Ctrl+Shift+X), search for “Live Server” by Ritwick Dey, and click Install.

2

Step 2 — Open the TaskFlow Project Folder

In VS Code, go to File → Open Folder, then select the folder containing the TaskFlow project (the one with index.html, style.css, and app.js inside it). VS Code will load all the project files into the Explorer panel on the left.

3

Step 3 — Click “Go Live”

In the Explorer panel, click on index.html to open it in the editor. Then, look at the bottom-right corner of the VS Code window and click “Go Live”. This starts a local development server and automatically opens the project in your default web browser.

4

Step 4 — Use the App

The TaskFlow app will now be running in your browser through Live Server. You can add tasks, set priorities and due dates, mark tasks complete, switch between views (Today, Upcoming, Calendar, Analytics), and see changes reflected instantly — any edits you make to the code will also auto-refresh in the browser.

Already Hosted Online

The steps above are useful for running and editing the project locally. However, TaskFlow is already deployed and publicly accessible online through GitHub Pages, so it can be viewed directly in a browser without installing VS Code or any extensions.
